

**Ambolt AI** is a highly specialized Danish company with deep knowledge of the various AI technologies, and development of many successful solutions.

The use of technology is a must if we are to improve processes in organizations, but systems should not be all-controlling and take over human control. Our philosophy is to deploy artificial intelligence when and where it makes sense, and as a supplement to human intelligence.

In short, we believe in Human-centric AI solutions helping people save time and resources.

Natural  
intelligence  
is needed to  
develop  
artificial  
intelligence

**AMBOLT AI**

# What Ambolt can do for you

Our passion and deep knowledge of AI technologies has brought us in a position to offer complete solutions seamlessly integrated in your environment, consultancy services, and even an AI platform if you want to develop your own AI projects.

Our experience with AI projects has shown us that many people who work with AI solutions would ideally like to leave the basic configuration to someone else and to concentrate on the actual problem solving themselves.

We've met this desire to be able to skip the basic configuration by developing the "Emily" AI platform. Emily allows you to bring your industry experience and expertise to the table

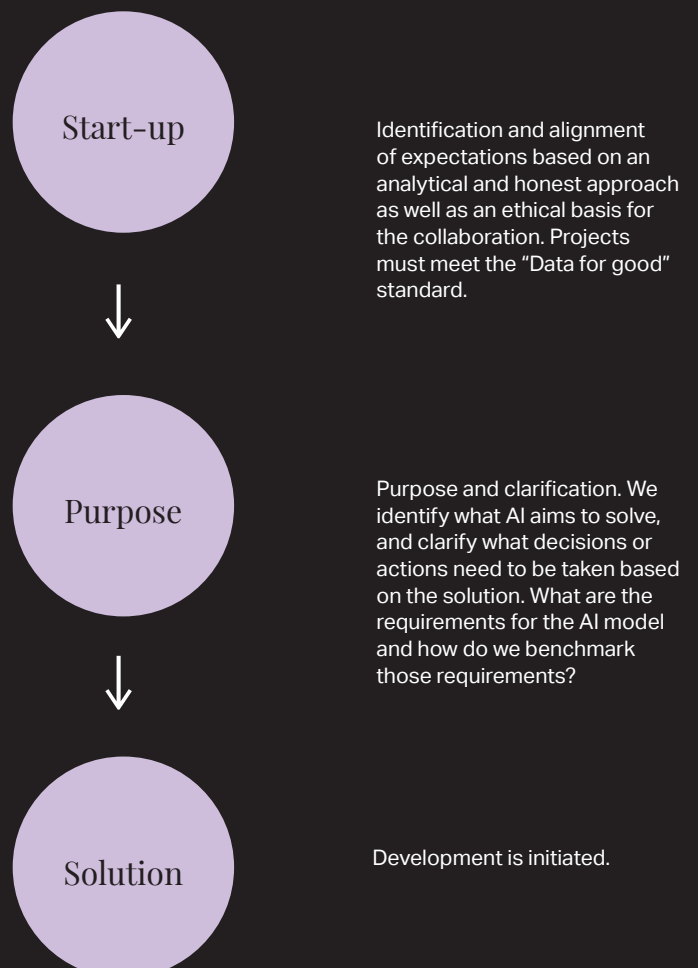

while letting Ambolt provide the AI platform and serve as a sounding board and consultant. Using Emily, you get to keep your data 100% in your own environment.

Emily AI is in use in a host of different applications and is also set to be used in teaching at universities all over the world.

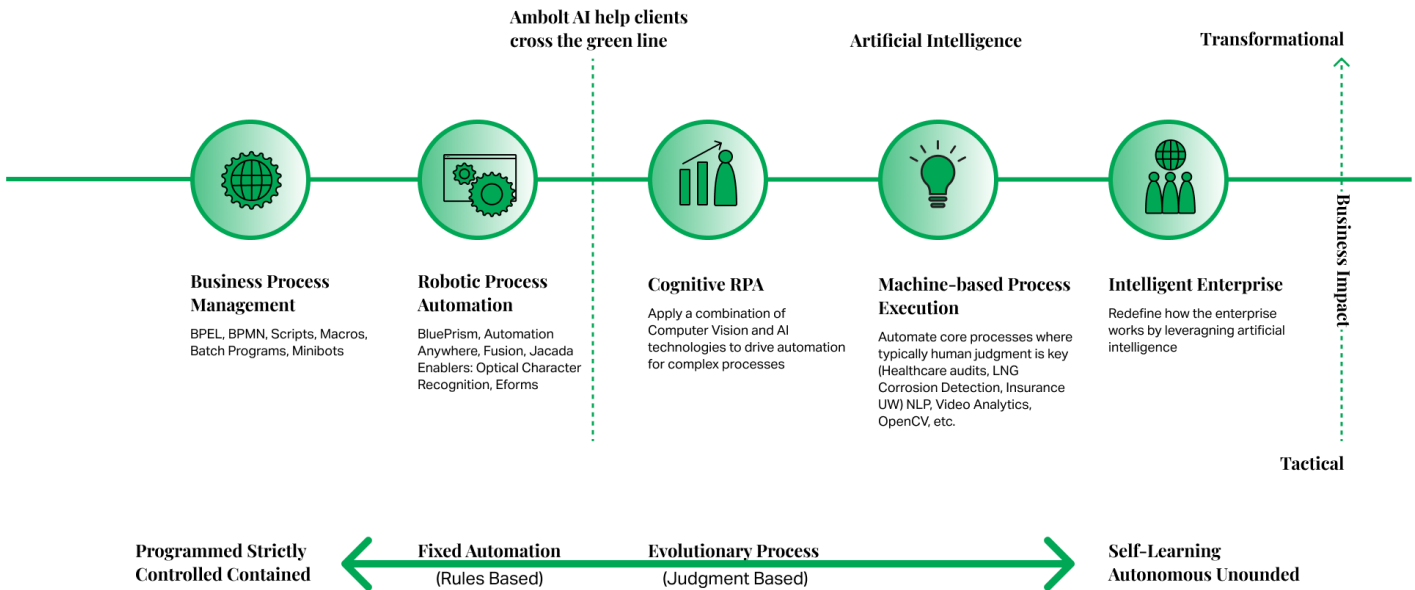

Our approach is to analyze rather than assume that data is of a certain volume. The project must be assessed critically by means of natural intelligence.

Contact us when your project requires a pair of outside eyes to get it moving forward, when your own experience has taken you as far as it can, or if you need other skills to reach your goal.

## Problem-oriented working method

# Your project, our process

## AI can take your business in a new direction

Decisions or processes involving a large quantity of data can be overwhelming or even impossible if you rely on human performance alone. This is where artificial intelligence can support with otherwise impossible tasks or automate tedious work.

Artificial intelligence can solve a host of problems, and it can play a valuable role in recognizing errors, health diagnostics and traffic optimization, for example.

It offers countless possibilities, and we know them and have tried most of them.

### Ambolt has added value to business areas as different as:

- Connecting doctors and patients by means of an app where questions to the patient are asked intelligently by an underlying machine-learning algorithm. Thus, a chance for the doctor to reduce time on initial diagnosis and be better prepared.
- Traffic regulation to optimize traffic efficiency especially during rush hour and consequently reduce fuel consumption.
- Analyze and structure qualitative data with NLP (natural language intelligence) to support the process of categorizing a large number of questions used for strategic initiatives in organisations.
